2026

June 8, 2026

Release date: June 8, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-5613	APD retrieves selector definitions from the database instead of the Lifecycle Manager (LCM) at runtime. This change decouples runtime operations from design-time dependencies, ensuring that production environments use the definitions included in the deployed package. Existing production environments are not affected, and new deployments automatically use the updated retrieval method.
APDS-5907	Fixed an issue where PolicyCenter failed to synchronize new terms and rules from APD when they were added via common properties. PolicyCenter now correctly detects updates to common properties by comparing the modification dates of both the edition and its associated common properties. This ensures that all clause terms, coverages, and rules are accurately synchronized during the update process.

May 25, 2026

Release date: May 25, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-5656	In previous releases, APD Runtime was listening for LCM_DEPLOYMENT_EVENT to notify PolicyCenter that a new package was available. APD Runtime now listens for

ID	Description
	APD_MIGRATION_COMPLETED_EVENT, which occurs after a package has been migrated from LCM to APD's runtime environment, thereby avoiding a fallback to LCM and unnecessary error handling.
APDS-5961	For drop-down options, the Short Name can have a value that starts with either a number or a letter, for example 1000, 15K, 20K.

May 11, 2026

Release date: May 11, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-5447	Tooltips have been added to checkbox labels.

April 13, 2026

Release date: April 13, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-5612	APD Runtime API V8 endpoints have been removed.

March 16, 2026

Release date: March 16, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Settings tab

The **Manage Languages**, **Manage Currencies**, and **Manage Rate Factor Types** functionality, previously available from the product's context menu in the left navigation pane, is now available on the **Settings** tab.

March 2, 2026

Release date: March 2, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

APD Runtime API V8 no longer supported (APDS-5263)

APD Runtime API V8 is no longer supported. For this reason, APD is not compatible with PolicyCenter in Jasper and previous releases.

Improvements and resolved issues

ID	Description
APDS-3703	The product tree navigation pane is resizable.
APDS-5388	Removed the 60-second background polling interval for Helios to reduce unnecessary network overhead. Helios calls are triggered by app reloads or context changes, ensuring more efficient resource utilization.
APDS-5453	The Edition Content screen displays default values with the correct uppercase and lowercase letters.

February 16, 2026

Release date: February 16, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4080, APDS-5245	In previous releases, the View Edition Content page for Common Properties or Editions did not load for large editions. Now the tree is loaded with 30 rows at a time to resolve the performance issue for large editions.
APDS-4349	Common Properties are no longer supported in environments that have not been migrated to APD. Editions generated with V10 in migrated environments continue to support Common Properties as expected.

February 2, 2026

Release date: February 2, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-5321	Resolved an issue where the immutable PackageState from LCM was not correctly downgraded to the v9 schema, which caused errors when quoting in PolicyCenter. The downgrade logic has been moved into shared APD common/runtime components so that immutable package states are now correctly mapped to production in v9, preventing quote failures after upgrade.

January 19, 2026

Release date: January 19, 2026

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-5127	If an edition references common properties, when the common properties are modified, the edition modification date/time is assigned the most recent value of the two resources. Modification of the date/time is done through the Runtime API for three types of requests: • An active edition is requested using filters or segments (selectors). • A specific edition is requested by code. • A list of editions for a product is requested.
APDS-5215	Performance is improved when saving a large product.
APDS-5228	Common properties are now backwards compatible with Version 9 of the APD Runtime API. This behavior can be turned off by using the Helios setting <code>apd.runtime.legacyEditionContent</code>. The default setting is <code>false</code> and uses the runtime edition content. Setting this property to <code>true</code> returns the design time edition content.

2025

December 8, 2025

Release date: December 8, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

[APD API v8 \(Jasper\) deprecated as of February 1, 2026](#)

APD API v8 (Jasper) will be deprecated as of February 1, 2026. If you are using a custom integration, you must use a URL of the form `https://apd.api.*.guidewire.net/api/v<version_number>/*`, where *version_number* is 9 or later.

Note: The APD user interface uses the latest version of the API. PolicyCenter uses the version of the APD API that is appropriate for the ski release.

[Merge two sets of common properties \(APDS-5087\)](#)

You can merge two sets of common properties in the same way that you merge two editions by clicking the **Merge Selected** button.

Improvements and resolved issues

ID	Description
APDS-4854	On the Editions page, editions can be sorted alphabetically by name or chronologically by Effective Date , Expiration Date , or Last Modified date.
APDS-5073	If a field that references a typelist has a rule such as a default value, the typelist's drop-down options can be edited, added, or removed. However, if there is a rule on the typelist option itself, it is not editable or removable.

November 10, 2025

Release date: November 10, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

[Toggle button to switch between APD-managed typelists and externally managed typelists \(APDS-4691\)](#)

A toggle button dynamically changes the typelists displayed in the drop-down list.

Improvements and resolved issues

ID	Description
APDS-4790	In previous releases, setting or clearing a rule for an Attribute removed the child option rules if the attribute was a drop-down. In this release, if the default values for an Attribute are set, the option rules are maintained.
APDS-4972	For a multi-line product, it is now possible to: • Assign tags to an element for a referenced line. You must lock the current edition. • Create, edit, and delete tag definitions. You must lock the product.
APDS-5072	In previous releases, the Common Properties Content View was not scrolling correctly. This issue has been resolved, but you may need to clear the cache or hard reload the page.

October 1, 2025

Release date: October 1, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4832	Selecting Save in the Properties pane saves common properties. It is not necessary to select Save for the product design.
APDS-4835	Highlighted text in the Edition Content View and the Edition Comparison View is visible.

September 17, 2025

Release date: September 17, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

[APD Runtime API V7 has been removed \(APDS-4820\)](#)

The APD Runtime API V7 has been removed. PolicyCenter ski releases Innsbruck and earlier are no longer supported.

August 6, 2025

Release date: August 6, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4788	When you remove a coverage rule or set the Availability to the default value, child coverage rules are not removed.

July 23, 2025

Release date: July 23, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Unless you are participating in an Early Access program, you cannot import products that originated in PolicyCenter into APD. Contact Guidewire to resolve the issue. (APDS-4619)

Improvements and resolved issues

ID	Description
APDS-4515	When uploading products to APD, detailed messages are displayed for regex validation errors. Products can be uploaded as XML, XMind, or ZIP bundle with JSON files.

June 25, 2025

Release date: June 25, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4552	When detaching a product line from a multi-line product, it is no longer necessary to manually remove references to the product line from the product's editions. If there are no locks placed by other users on any of the editions, APD removes the references. If there are locks placed by other users, you are prompted to remove the locks.

June 11, 2025

Release date: June 11, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4165	It is now possible to check and uncheck the Schedule Coverage checkbox.

May 28, 2025

Release date: May 28, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4508	In previous releases, multi-line products were not imported due to failed validation of linked lines. This issue has been resolved.

May 14, 2025

Release date: May 14, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4194	For numeric types, zero values are allowed in rules as the default, minimum, and maximum values.
APDS-4298	In previous releases, importing a mind map overwrote the value in Menu Label for Generated UI with the short name. The value in this field is now preserved.

April 30, 2025

Release date: April 30, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

[Reference Data APIs available externally \(APDS-4361\)](#)

Reference Data APIs are now available externally.

[APD Runtime API V6 removed \(APDS-4375\)](#)

APD Runtime API V6 has been removed. APD can no longer be used with the Hakuba release of PolicyCenter.

April 16, 2025

Release date: April 16, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

[Info panel has been removed \(APDS-3940\)](#)

In the pages for product elements such as line, risk, product, and blanket, there was previously a card under the title that contained the following items:

- Accordions with information about the edition and element details
- A drop-down in the top-right listing actions such as **Edit**, **Remove**, and **Add child object**

These actions can now be invoked from the left tree panel as follows:

- Element details can be viewed by clicking the **Edit** or **View** action on the element.
- The **Edit**, **Remove**, and **Add child object** actions can be invoked from the drop-down on the appropriate node.
- The **Manage currencies**, **Manage languages**, **Manage rate factor types**, and **Attach line** actions can be invoked from the drop-down on the product node.

Edition information can be viewed on the Editions page.

Blanket details no longer appear on Info panel (APDS-4166)

The accordions at the top of the **Blankets** page that contained details about the edition and blanket associations have been removed. Blanket associations now appear at the bottom of the page in a card titled **<Blanket Name> associations**.

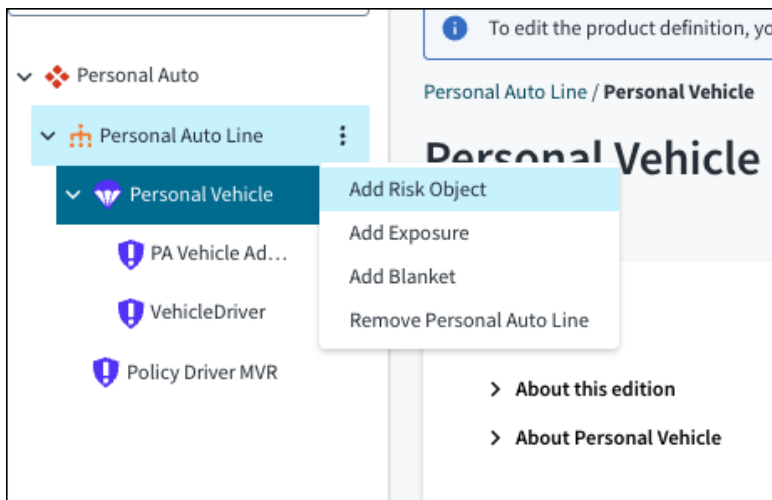

March 19, 2025

Release date: March 19, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Add elements items are moved to the Action menu in the tree panel (APDS-3710).

Improvements and resolved issues

ID	Description
APDS-4274	When an edition is linked or associated with a CommonRuleset, the ActiveEdition in PolicyCenter contains a merge of all the rules. Local editions override CommonRuleset rules.

March 5, 2025

Release date: March 5, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Beginning in April 2025:

- The APD API version 6 is no longer supported.
- The APD API version 7 is deprecated.
- APD no longer supports the Hakuba release.

Improvements and resolved issues

ID	Description
APDS-4212	The Reference Data Manager fetches and uses the descriptions for drop-down options if the descriptions are available in PolicyCenter.
APDS-4251	A product's CommonRuleset objects and references are included in the export of Product and Editions.
APDS-4266	Rate factor codes can begin with a lowercase letter and can contain underscores and other special characters.
APDS-4270	APDClient CachingClients implement Invalidatable, providing an invalidateCache function that can be used to force invalidation of both design and production products.

February 18, 2025

Release date: February 18, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3772	In previous releases, when you navigated through a list of attributes or coverages to a page other than the first page, and then remained idle for approximately one minute, the list view returned to the first page. The view now remains on the current page.
APDS-4169	Whenever you synchronize data from the Reference Data Manager, a toast message is displayed indicating that the sync was successful.
APDS-4197	Because APD API versions 1 through 5 have been removed, PolicyCenter releases older than Hakuba are no longer able to use the APD service.

February 4, 2025

Release date: February 4, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Using the **My APD Products** widget, you can pin an APD product on Guidewire Home and, optionally, specify which edition to use when opening the product.

Improvements and resolved issues

ID	Description
APDS-4162	The external gateway <code>api.apd.*.guidewire.net</code> was discontinued on January 31, 2025. If you attempt to use this base URL for client configuration, you will receive connection errors.

January 21, 2025

Release date: January 21, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

If you are using the APD API or PolicyCenter with APD, the pattern you use to access the API has changed from

```
https://api.<region>.guidewire.net/apd
```

to

```
https://apd.api.<region>.guidewire.net
```

The old format is supported until the end of January 2025.

APD API versions 1-5 are deprecated and will be removed by the end of January 2025. You must use version 9 or version 8 to remain compliant with supported releases.

Improvements and resolved issues

ID	Description
APDS-4120	The APD Runtime V10 API has been updated to include only the endpoints necessary for APD in PolicyCenter to function in Runtime. Some endpoints that were previously part of the Runtime service have been removed as they are no longer needed, or they have been consolidated. Runtime endpoints no longer require a GRN (Global Resource Number) and instead accept package ID and planet as parameters for authentication.

January 7, 2025

Release date: January 7, 2025

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4160	A bug was fixed that was causing policies bound on Kufri and Las Leñas releases between December 12, 2024 and December 19, 2024 to incorrectly set the <code>LastUsedWorksetId</code> . This bug led to issues with Policy Change and Renewals using Stored Editions. It can be resolved using SQL Scripts to update the applicable fields. You must restart PolicyCenter to clear the bean cache.

2024

December 11, 2024

Release date: December 11, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4122	When an edition with no rules is selected, an appropriate message is displayed in the Edition Content View .

November 27, 2024

Release date: November 27, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

APD fetches typelists from PolicyCenter (APDS-2376)

For languages, currencies, and rate factors, APD fetches the appropriate typelist from PolicyCenter. You do not need to re-create the typelist manually.

You can use a PolicyCenter typelist as an externally-managed typelist in APD. The names and definitions of PolicyCenter typelists are available in Guidewire Studio. Previously, you were required to add options to such typelists to match the definitions in PolicyCenter exactly. This process was simplified, and APD can fetch the definition directly from PolicyCenter.

API versions 1 through 6 deprecation

In an upcoming sprint, API Runtime versions 1 through 6 will be deprecated. Guidewire recommends using version 9.

Edition locking (APDS-4054)

You can choose and lock an edition from the toolbar. Multiple users can edit a product and its editions at the same time. You can modify an edition's properties and rules even if the product model is locked by another user. However, to modify the product model, for example to add a coverage, you must lock the product model.

View edition content (APDS-2526)

You can view edition content in a tree and search for elements and attributes. For example, you can search for a rule and then click the link to display the rule and its properties.

Change to subtype field value

The subtype field value for APD Product Metadata stored in InsuranceConfiguration has changed. For example, the subtype field is now stored as `Field` instead of `APDFieldDTO`:

```
"subtype" : "APDFieldDTO",  
  
is now  
  
"subtype" : "Field",
```

Improvements and resolved issues

ID	Description
APDS-4070	Multiple users can edit a product and its editions at the same time. For example, you can lock the product definition while another user locks an edition, and yet another user locks a different edition. You can lock more than one resource at a time.
APDS-4084	When you update a product using a template, you must lock or unlock the product and its editions. When you update a product using a mind map, you must lock or unlock the product. If the mind map creates rules, lock or unlock the Base Edition.

October 29, 2024

Release date: October 29, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-4049	In previous releases, closing the right panel displayed the product line's details in the central panel instead of the details for the expected element, for example clause or blanket. This bug has been fixed. You may need to do a hard refresh or clear the browser cache to see the correct screen.

October 15, 2024

Release date: October 15, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3309	In previous releases, when switching context between projects, the old context was being used, causing feature-flagged elements to be enabled and disabled. This issue has been fixed.

October 1, 2024

Release date: October 1, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3996	If you update a product from a mind map that provides new clause terms, the new terms are added to the end of the dropdownColumns in the definition of term items regardless of their position in the mind map. If this order is incorrect, remove the clause term and re-add it so that the order is correct.

September 3, 2024

Release date: September 3, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3908	Because blankets do not support a parent-child clause hierarchy, Calculated is no longer available as an option in Value Type for rule value definitions for clause terms.
APDS-3943	For option and package term types, leaving the default value blank without deleting the term's rules no longer results in a Cannot find drop-down option "" for term "TermCode" error in PolicyCenter.

August 20, 2024

Release date: August 20, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3853	Basis attributes are now imported into APD App from XML.

August 6, 2024

Release date: August 6, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-2379	The effective date/time and expiration date/time for editions are now displayed in the correct timezone.
APDS-3702	In the navigation pane, the tree now expands the appropriate nodes based on the URL when the page renders. When you click a different node, the URL is updated.
APDS-3704	In the navigation pane, upon page render, the tree now expands to show all lines up to the second level.

July 23, 2024

Release date: July 23, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Modifiers

Rate, scheduled rate, Boolean, and date modifiers are supported on the product, product line, and risk object levels. Drop-down list modifiers are supported on the product line and risk object levels but not on the product level.

Blankets

Blankets are used to cover risks in multiple locations and provide adequate coverage in the event of a loss. Policies that cover Commercial Property (including Commercial Package), Business Owners, and Inland Marine can have blankets. A blanket can cover buildings (including contents), business income, or both.

Improvements and resolved issues

ID	Description
APDS-3768	The Basis Attribute is now supported on the Billing screen for cost definitions.
APDS-3782	The product search icon is now displayed correctly in non-English locales. In addition, a change has been made to how filtering is done in both the tile and grid views. Instead of using starts-with logic when matching a product name, description, or abbreviation, substring logic is used. As before, products that have an exact match on any of these three attributes are placed at the top of the list.
APDS-3817	The UI now provides more specific messages related to parent product validation: • Specific content and reason messages are displayed in toasts. • Console logging indicates the planet and package used for parent product lookup.

July 9, 2024

Release date: July 9, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3707	The product path has been moved from the Info panel to the top of the page above the page title.

June 25, 2024

Release date: June 25, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3750	APD attempts to store formatted versions of the product content resources in the LCM Git repository. If the formatted version is too big to fit within LCM limits, APD does not use formatting and instead stores resources as single-line JSON.

June 11, 2024

Release date: June 11, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3749	The internal <code>packageName</code> is no longer stored with edition content in Lifecycle Manager.

May 28, 2024

Release date: May 28, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3215	If the stored product edition is used, new product elements such as fields and coverages are unavailable for existing policies during a policy change.
APDS-3564	In previous releases, the <code>ScheduledItem</code> code was generated from the parent risk name, and if the parent risk name contained characters not allowed in the code, an error occurred when adding a new <code>ScheduledItem</code> . The code generation logic has been changed to derive the <code>ScheduledItem</code> code from the risk code instead of from the risk name, ensuring compliance

ID	Description
	with validation rules. New typelists are now created without errors.
APDS-3765	A change to how parent products are looked up for validation introduced an error when Lifecycle Manager deployment worksets were deleted. This issue has been resolved.

April 30, 2024

Release date: April 30, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3504	When removing rules on a clause, clause term rules are now preserved. For example, consider the following rule configuration: <pre> Clause1 - Rules - Available Rule: Required - Terms - Term1 - Rules - Default: 1 - Term2 - Rules - Default: 1 </pre> When removing the required rule or selecting optional (default availability) for the rule in Clause1, the Term1 and Term2 rules are preserved: <pre> Clause1 - Rules - Terms - Term1 - Rules - Default: 1 - Term2 - Rules - Default: 1 </pre>
APDS-3593	Resources saved in Lifecycle Manager are no longer pretty-printed.
APDS-3608	Runtime endpoints are now available externally.

March 5, 2024

Release date: March 5, 2024

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

ID	Description
APDS-3416	When selecting a typelist for multiple drop-down lists in a product, the application was incorrectly adding a duplicate typelist (without the options) to the product definition. This issue has been resolved in two ways:

ID	Description
	• Validation is added to ensure that a product with duplicate typelist codes fails and is not saved. • When modifying products in APD App, selecting an existing typelist no longer duplicates the entry in the list of available typelists. Ensuring the product is not saved with duplicate typelists in APD App resolves the issue in PolicyCenter.

2023

December 12, 2023

Release date: December 12, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

[Resolve null currency values \(APDS-3359\)](#)

To avoid errors when you attempt to synchronize a product with the cloud, you must resolve null currency values:

- When you lock a product, APD identifies null currency values and provides a way to resolve them.
- When you import or update a product from a mind map, APD identifies money drop-down items and prompts you to choose a currency.

[Merging editions requires locking the product \(APDS-3390\)](#)

In order to merge editions, you must first lock the product.

Improvements and resolved issues

ID	Description
APDS-3406	In earlier releases, the language code was required, resulting in errors when updating a product from a mind map. The language code is now optional.

November 28, 2023

Release date: November 28, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Support for contains operator (APDS-2649)

It is possible to use the contains operator in rules for operands of type string, for example IF TextField contains abc THEN Hello.

Improved support for modifiers (APDS-2839)

Support for modifiers has been improved:

- Rules on product-level modifiers are supported.
- Rules are supported in visualized mode in PolicyCenter.
- A rate factor can be the anchor of a complex rule.
- Tags are supported.

Support for custom languages (APDS-2906)

You can make translations available for a custom language using the **Manage Languages** dialog. The language code used in PolicyCenter must match exactly the language code used in Advanced Product Designer App.

Support for custom currencies (APDS-2979)

You can add custom currencies using the **Manage Currencies** dialog. The currency code used in PolicyCenter must match exactly the currency code used in Advanced Product Designer App. Custom currencies are supported in API v7 and later.

Improvements and resolved issues

ID	Description
APDS-3372	When working in a package mode environment, APD performs a parent workset test using the following logic: • Look for any currently active deployments within a non-draft environment (local/dev). • Look for the product being edited by product code. • Perform validations against the parent product such as removals and changes.

November 14, 2023

Release date: November 14, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Package-based parent/production class lookup for validation (APDS-3148)

In package mode, when a product is saved, APD attempts to check for the most recently deployed version of the product to ensure that there have been no removals or edits. With the new planet design structure, most of these comparisons must be done during the GIT MERGE process, as it is not possible to determine which version is the most recently released version of the product.

Improvements and resolved issues

Cannot remove product from child workset (APDS-3262)

The **Remove Product** option is now available for products in a child workset. Removing a product from a child workset reverts the active product to the corresponding product in the parent workset.

Validation bug on RateFactorType field (APDS-3307)

The name of a rate factor type can now begin with an uppercase letter, lowercase letter, or number.

Make the edition identifier editable (APDS-3322)

It is now possible to modify the **Edition Identifier** in **Edit Edition Details** in order to resolve a duplicate code warning message.

October 17, 2023

Release date: October 17, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Information message for locked products has changed (APDS-3179)

When working in a non-draft workset (workset mode) or an immutable deployed package (planet mode), APD App displays the message **Read-only: Changes are not allowed within non-draft environments**. To make changes, you must do one of the following:

- Change the Guidewire Cloud Home context to a draft workset.
- Re-deploy a new package to the planet.
- Change the Guidewire Cloud Home context to a new planet.

Exported product and edition JSON files are properly formatted (APDS-3189)

When exporting a product and its editions to a ZIP file, the JSON files contained therein are now properly formatted.

October 3, 2023

Release date: October 3, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Change to UUID causes update to fail (APDS-2881)

When updating a product definition that exists in either the current or parent (production) workset, APD now checks that UUIDs for product model elements such as fields, clauses, and terms have not changed. If a UUID in the product definition has changed, the update fails.

September 5, 2023

Release date: September 5, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Add REST API endpoint to retrieve pc-apd-codegen schema (APDS-3144)

A new GET endpoint was added to the REST API that allows for retrieval of annotation layer JSON schemas. As these schemas have names, the schema name must be provided as a parameter in the API call. Currently, the only available schema is internal and has the name pc-apd-codegen.

August 22, 2023

Release date: August 22, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Export product to JSON with annotation layer (APDS-2934)

A new folder, annotations/, has been added to store annotations when exporting a product to JSON. The files in the folder have names of the form <product_code>-<annotation_name>.json, for example MSK-name_overrides.json.

August 8, 2023

Release date: August 8, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

Separate charge and Separate breakdown labels are switched (APDS-3044)

The **Separate charge** and **Separate breakdown** labels were switched on the **Billing** screen. If you are using either of the following pairs of settings, you must correct them:

- Separate charge = true, Separate breakdown = false
- Separate charge = false, Separate breakdown = true

July 25, 2023

Release date: July 25, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Rate modifiers

Rate modifiers are used to adjust a policy's premium based on a set of risk characteristics. A rate modifier that has multiple rate factors is called a scheduled rate modifier. You create a rate modifier at the product level or at the product line level. An underwriter sets the value of a rate modifier when they create a submission for an installed product in PolicyCenter. If the rate book uses the modifier, the value is submitted to a rating engine which then calculates the premium for the policy.

Section-based charging and negotiated commission

Large commercial policies are broken down into sections, or groups of like coverages, for the purposes of underwriting, rating, and specifying the payment and settlement currencies. You can define premiums and costs based

on sections (section-based charging). You can also set a different commission rate for a particular section based on risk or exposure (negotiated commission).

Code generation for multiple products

For code generation for multiple products, the code for each product is generated sequentially, without cleaning the directory after each code generation, so the branch has all changes without requiring a manual merge.

XML-to-mind-map conversion tool is no longer available (APDS-3032)

The XML-to-mind-map conversion tool is no longer available. Instead, choose **Export Product to Mind Map** from the product's ... menu.

Improvements and resolved issues

Display better message when DuplicateProductCodeException occurs (APDS-2410)

Error handling is improved when creating a new product by uploading a template or mind map. More informative error messages are now displayed when duplicate abbreviation codes are detected.

July 11, 2023

Release date: July 11, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Add a custom language code in the Manage Languages dialog (APDS-2972)

You can now add a custom language code to the **Languages** list in **Manage Languages** simply by displaying the drop-down and typing the code, thereby making it possible to provide translations for nearly any language. If you enter an existing language code, the corresponding language is selected.

Improvements and resolved issues

Text cannot be reached using a screen reader (APDS-2846)

Text is now accessible using a screen reader.

Updating product with mind map is not overwriting segment field (APDS-2981)

When updating a product from a mind map that contains a segment field with a label of the form `SegmentName-FieldCode`, the original segment field was not detected in the product and the segment was duplicated, thereby causing the update to fail. This issue has been fixed.

Also, in a mind map, if a category exists, a segment field with a label of the form `SegmentName-FieldCode` was not added to the category. This issue has been fixed.

June 27, 2023

Release date: June 27, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Create Base Edition button (APDS-2876)

In previous releases, it was possible to import a JSON ZIP file with no editions. The file imported successfully but the product did not open. In this release:

- If the file does not contain editions, click **Create Base Edition** in the **Select Edition** popup.
- If there is only one edition, that edition is selected automatically. The **Select Edition** popup does not appear.

Improvements and resolved issues

Mind map import does not add availability rules for nested attribute or option to base edition (APDS-453)

In a mind map, product definitions can be designed with hierarchical fields and typelists. If this is the case:

- The lower level fields are applied to the current risk object or coverage.
- A base edition is generated with availability rules and a condition based on the dependent field and selection. The default is set to Unavailable.

When updating a product from a mind map, a base edition is generated for the mind map. The mind map base edition is then merged with the current base edition. If there is no base edition, the base edition from the mind map is saved.

Items in the left navigation pane are inaccessible for keyboard users (APDS-2880)

The left navigation pane can now be accessed using the Tab key. Items can be collapsed, expanded, and selected using the keyboard.

Search does not return any editions (APDS-2915)

On the **Editions** screen, it is now possible to search for editions by name, description, identifier, and jurisdiction.

June 13, 2023

Release date: June 13, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

Rule condition editor displays not exists for a selected condition (APDS-2827)

In previous releases, editing a SELECTED or NOT SELECTED rule was displaying the opposite condition. For example, when editing a rule with SELECTED (exists), the rule editor was displaying the NOT SELECTED (not exists) condition. This issue has been resolved.

Importing a JSON zip file does not fail if no products are found (APDS-2899)

In previous releases, when you import a zip file that does not contain any products, a message indicates that import was successful even though no products or editions were added. Now an error message is displayed stating that no products were found.

May 16, 2023

Release date: May 16, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Improvements and resolved issues

Option code does not allow numerical or lowercase characters (APDS-2723)

Option code validation now allows any alphanumeric character to be the first character of an element's **Short Name**. This is now consistent with the back-end validation.

JSON import checks tag value when importing multi-line product from a JSON ZIP file (APDS-2745)

When attaching a line for a new multi-line product, APD copies mono-line product tags to the multi-line product. When there are tags with the same code and different labels, APD concatenates the labels together (e.g. "Label1 / Label2"). However, tags with the same code and same labels are not concatenated. Users can clean up the labels in the **Manage Tags** page after attaching the mono-line.

For existing multi-line products, users need to detach the mono-line and then reattach the line in order for the tags to copy over to the multi-line product.

Null pointer exception occurred during export of a product with no lines (APDS-2782)

Mono-line and multi-line products with no lines can now be exported to XMind format.

May 2, 2023

Release date: May 2, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

New URLs for APD API

The URLs for the APD API have changed from <https://apd.api.us-east-2.service.guidewire.net> or <https://api.us-east-2.service.guidewire.net/apd> to <https://apd.api.omega2-andromeda.guidewire.net>.

Improvements and resolved issues

Validate that the referenced terms for a reference function are of the same clause type and from the same coverable hierarchy (APDS-2713)

The product definition JSON is now validated to ensure that the referenced terms in a calculated value rule are from the same coverage hierarchy as the anchor term and are of the same type.

A package term can have a mixed number of values for the options (APDS-2744)

The APD service no longer raises a validation issue when the number of package option values (drop-down values) is less than the number of package columns. A validation issue is still raised if a package option has no values at all, or has more values than the number of columns in a package term, or if a value references a non-existent column using the column's sequence number.

Cannot add tags to the product (APDS-2748)

The **Properties** pane for a risk element now displays a message if the element has no tags.

April 18, 2023

Release date: April 18, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Check Out and Check In buttons are now labeled Lock to Edit and Lock

The Check Out and Check In buttons are now labeled Lock to Edit and Lock.

Improvements and resolved issues

Prevent removal of typelist entry if it has a rule specified (APDS-2687)

The correct validation issue is returned when a drop-down list entry has a rule associated with it or it is referenced in a condition of another rule.

Edition remains selected after merge (APDS-2691)

A merged and deleted edition remained selected, thereby making it impossible to merge other editions. The selection in the Editions table is now cleared.

Importing mind map with segment field fails (APDS-2719)

When you create a segment field in a mind map, you must specify the segment and field codes in the label, for example `segment_code-field_code`.

Default value drop-down for segment field has incorrect options (APDS-2732)

The drop-down list for the default value of a segment field now contains the correct values.

April 3, 2023

Release date: April 3, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Multi-line products

The product line in a mono-line product can be attached to one or more multi-line products. For example, if you represent a business, you can buy a general liability product that includes only the general liability line and a commercial property product that includes only the commercial property line. Or, you can buy a commercial package product that includes both the general liability and commercial property lines. As another example, an insurer can sell multiple products, each of which includes the same lines. A product can be targeted to a particular type of customer such as a restaurant, hotel, or university.

Write unit tests

You can validate an installed product and its editions using a local APD service plugin that implements the interface `IApdServicePlugin`. You cannot use this approach with a visualized product.

Test policy transactions

Using a local installation of PolicyCenter, you can test policy transactions that call editions from APD App. You must use a development version of the APD service plugin and authenticate against APD App using a token.

Move to a new release of PolicyCenter

When you move to a new release of PolicyCenter, move each cloud insurance product to the new release by doing one of the following:

- Regenerate the insurance product.
- Create a typelist extension for the insurance product.

You only need to regenerate or create a typelist extension once. This step will not be necessary the next time you move to a new release of PolicyCenter.

Product definition JSON validation enhancements

Product definition JSON validation has been improved. Potential issues are identified on save and import rather than during code generation.

Improvements and resolved issues

Enable and import product with edition JSON (APDS-1501)

It is now possible to import the exported product ZIP file. All product and edition JSON files are stored under the product/ and editions/ folders respectively.

Validate product updates against a product in a non-draft workset (APDS-2551)

Validation is added when saving or updating a product. When a product is extending a product from a production workset, certain fields and elements cannot be removed or modified. The product is considered invalid if the following are removed in the child product definition:

- Field or exposure field
- Typelist entry
- Coverage, condition, exclusion, term, or term option

The product is considered invalid if the following are changed in the child product definition:

- Field type is changed
- Typelist is changed for the typelist field
- Sequenced item is re-ordered

Validate subclause has the same clause category as the parent (APDS-2553)

When posted through the APD API, the product definition JSON is now validated to make sure that subclauses have the same clause category as their parent clauses.

Validate subclause is from the same coverable (APDS-2554)

When posted through the APD API, the product definition JSON is now validated to make sure that subclauses come from the same coverable (risk object) as their parent clauses, and also to make sure that they are of the same clause type. For example, if CoverageA was under risk object Location and CoverageB was under risk object Building, they could not have a subclause relationship because the coverable is not the same. Also, CoverageA could not be the parent clause for ConditionA because they are of different clause types.

Validate subclause hierarchy has no cycle (APDS-2555)

When posted through the APD API, the product definition JSON is now validated to make sure that there are no cycles in subclause hierarchies. A cycle occurs when ClauseA is the parent clause for ClauseB, ClauseB is the parent clause for ClauseC, and ClauseC is the parent clause for ClauseA. A cycle is considered invalid.

Validate the referenced terms for a calculated value are from the clause family (APDS-2557)

Product definition JSON is now validated such that the reference terms of a calculated value rule must be from the same clause hierarchy as the anchor term.

Validate the type for calculated value (APDS-2558)

When posting a product definition in JSON format to the APD API, there is a new validation that makes sure that calculated values are specified in the rules only for attribute types that can be calculated. Calculated values are supported for the following types:

- bigdecimal
- typekey (only option and package terms)
- integer
- money
- date (with an exception of sum function)

Calculated values are not supported for the following types:

- boolean
- typekey (non-terms and typelist terms)
- segment
- location
- party
- varchar
- damageable

Attributes that are referenced in the calculated value functions (min, max, sum) must have the same type as the attribute that the rule is based on. For example, if a rule is for a money type field, all attributes referenced in the calculated value function must be of type money as well.

Non-monetary option/package cannot have currency specified (APDS-2559)

When posted through the APD API, if a drop-down option has a currency value specified and none of the drop-down columns are of type money, that currency value is ignored (nullified).

Validate typelist for field/term (APDS-2563)

When posting a product definition in JSON format to the APD API, all typelist attributes, including fields, exposure fields, terms, and claim attributes, are now validated to ensure that a referenced typelist exists. If not, a validation error is returned.

Validate basis attribute for cost definition (APDS-2570)

The product definition JSON is now validated so that the `basis` of a `costDefinition` must be a path pointing to an attribute of type `INTEGER`, `BIGDECIMAL`, `MONEY`, or `TYPEKEY`. The `basis` must belong to a coverable that is a parent of the associated risk or coverage, or it must be a child of the coverage's risk if the `costDefinition` belongs to a coverage.

Remove drop-down column/value type validation (APDS-2689)

When posted through the APD API, the product definition JSON is no longer validated to ensure that drop-down values are compatible with drop-down column type definitions.

March 21, 2023

Release date: March 21, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

What's new

Merge editions

The number of editions in a product can become quite large. To reduce the number of editions, you can merge two editions into one. When you merge two editions:

- All segment values are included.
- The earliest effective date and the latest expiration date are used.
- The name and identifier for the merged edition are taken from the name and identifier for the higher priority edition.
- You can choose which edition is higher priority.

Improvements and resolved issues

Validate the number of columns and value types for option/package term (APDS-2561 and APDS-2565)

When posted through the APD API, the product definition JSON is now validated to ensure that drop-down values are compatible with drop-down column definitions. For example, consider a drop-down column definition for a package term that includes two columns, one of type Money and another of type Count. Each drop-down option must have two values specified, the first of type decimal and the second of type integer, because the types decimal and integer are compatible with the types Money and Count.

February 21, 2023

Release date: February 21, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

New and changed

Create an attribute category

Use categories to organize risk attributes into sections. Sections are used to group risk attribute questions when a user creates a submission in PolicyCenter. You can create an attribute category at the product line or risk object level. The category is available to the risk object and any exposures that are children of the risk object.

Fix

Clause Availability now displays correctly (APDS-2284)

Clause Availability now displays correctly in the **Elements** table.

February 7, 2023

Release date: February 7, 2023

Note: It might take up to three weeks from the release date for changes to be deployed to your environment.

Fix

Order of attributes in the mind map is not preserved on import/export (APDS-2378)

In previous releases, if you rearranged the order of the attributes for a product in APD App and then exported the product, the order was not preserved when you imported the product. This issue has been resolved for attributes that do not belong to any categories.

2022

New and changed

2022.M11

[Introduce rate limiting on our API gateway \(APDS-2082\)](#)

The number of API requests is limited to 150 per second.

2022.M10

[Billing tab now available \(APDS-193\)](#)

Some of the functionality available on the Pricing screens in PolicyCenter is now available in APD App on the Billing tab. You can define line-level and coverage costs as part of the insurance product, and call out breakdowns within charges while keeping premiums and taxes as separate charges.

[Support Tenant Context Switch in APD \(APDS-1959\)](#)

APD App supports tenant context from Guidewire Cloud Home for administrator users.

2022.M8

[Import from APD template to include Loss Party Type \(APDS-1755\)](#)

Product template XML files with segment fields and editions containing segments can be imported into APD App.

[XML templates contain segment information \(APDS-1765\)](#)

You can import an XML template that contains segment information.

[Change to GET edition endpoint \(APDS-1783\)](#)

GET edition endpoint now includes segment information.

2022.M7

Autocompletion matches substring

For Add Rules, autocompletion matches not only the initial characters in the string, but also matches a substring in the middle of the string, for example the beginning of a field name. You must type at least two characters before results display. If there are no matches, an appropriate message is shown. The search is case-insensitive.

Add languages from Manage Languages dialog

A product's secondary language, if any, is listed in the Manage Languages dialog invoked from the product's ... menu. You can add multiple languages from the list of out-of-the-box languages for translation. You can also remove existing languages and the associated translations.

New attributes added to Clause Details

Exposure Type and Loss Party Type attributes have been added to the Clause Details panel under the Claims Information accordion at the bottom of the panel.

2022.M6

Short name must be unique

The short name must be unique for all coverables and exposures within a product.

Importing descriptions from a mind map

In previous releases, it was possible to populate the descriptions for clauses and clause categories using notes in the mind map. In this release, descriptions are populated using title in the mind map.

Stable version of the APD API now available

Release v3 (STABLE) of the APD API and a new endpoint version v4 (EVOLVING) are now available. The schema will not change for the STABLE version, while it is possible that the EVOLVING version contains breaking changes.

2022.M5

Cloning an APD product

You can clone an APD product, including editions, to a new identical product.

2022.M3

Checking out an APD product

To edit an APD product, you must first check out the product. Checking out a product puts a lock on it so that others cannot make changes to it. While you have the product checked out, you can make changes and save them. When you have completed your changes, you can check them in. Checking in your changes saves the product and its editions and then releases the lock so that others can check out the product. If a product is checked out, a message is displayed indicating that it is checked out and the option to check out the product is disabled.

2022.M2

Moved doNotRegenerate flag to typelist from attribute

The product data model has changed. The Do not regenerate field was moved from the attribute to the owning typelist. This change affects API consumers. For UI consumers, this change has no impact.

Fixes and enhancements

2022.M12

Fixes

ID	Description
APDS-2123	Consider the case where you import a template that has rules associated with an edition. If the edition has spaces in its name, the rules are now imported correctly.
APDS-2156	Use of the slash (/) and percent (%) characters is now permitted in the short names for drop-down entries under option and package coverage terms, regardless of whether the values are provided through the APD App UI, an XML template, or a mind map.

2022.M11

Fixes

ID	Description
APDS-1372	APD App displays a validation error when you attempt to create product lines with the same Line Prefix or Line Identifier , even if the product lines are used in different products.
APDS-1902	Rules can be applied to scheduled coverage options.

2022.M10

Fixes

ID	Description
APDS-1885	A multi-line product can be imported into APD App without errors.
APDS-1970	If a selector does not have a label, the code is used as the label in APD App.

2022.M7

Fixes

When you create a clause category from the drop-down menu, APD automatically generates a corresponding short name based on the name you provide. If you enter a name for which the resulting short name is invalid, use the Manage Clause Category screen to create a label and a short name. Manage Clause Category is disabled when there are no categories present on the risk or exposure, or when you have edited the clause without saving.

2022.M6

Fixes

You cannot create a new product that uses the code or abbreviation for an existing product in the current workset.

2022.M5

Fixes

When you create a product using a mind map, the descriptions for exposure and scheduled item drop-downs are populated with the value extracted from the title.

You cannot use the code or abbreviation for an existing product when you create a new product by cloning.

2022.M3

Fixes

In previous releases, elements were not compared consistently. In most cases, when updating an element, APD App attempted to match the code of an element with the label in the mind map. If the label did not exist in the mind map, APD App attempted to compare the code with the title in the mind map. However, for some elements, such as fields, only the code and title were compared; the label was ignored. In this release, all elements are first compared by the label, and then by the title. For this reason, use labels in your mind maps so that the correct elements are updated.

The 30-character limit on titles of fields and terms is not currently enforced by APD App. If an element's code exceeds the 30-character limit, the code is matched with the mind map label or title and updated as required. However, when you import a mind map, and the label or title exceeds the 30-character limit, a new shorter code is generated by APD App.

Enhancements

You can now update a product using a mind map. Updating a product using a mind map modifies existing elements and adds new elements to the product; it does not remove elements from the product.

Known issues

This section contains a non-exhaustive list of issues that Guidewire is aware of. Guidewire is working on resolving these issues.

[Toolbar for locking editions is not visible \(APDS-4154\)](#)

Issue

You may not see the toolbar or may encounter an error when trying to save the APD configuration, for example `This product is not currently available and has inconsistent edit statuses in Workset Manager`. If you need immediate access, please contact your admin for assistance.

Workaround

Refresh the cache:

1. Open the **Browser Developer Tools** window by pressing F12 or by accessing it through the Settings menu.
2. Right-click the **Refresh** button and select **Empty Cache and Hard Reload**.
